GKit — Premium Branded Fashion Store

Online destination for original Nike, Adidas, Jordan & New Balance — built on OpenCart

STORE

GKit (gkit.com.ua) — premium branded clothing, footwear & accessories. Works exclusively with verified suppliers. No replicas.

MARKET

Multi-brand retail. Delivery nationwide. Payments: Privat24, Monopay, Visa/Mastercard.

PLATFORM

OpenCart CMS with KeepinCRM integration for inventory & order management.

TASK

Full website development from mock-up stage, followed by SEO launch & first-month growth.

Building on a Glass Foundation

A new store, a complex catalog, and zero organic history — every decision had to be right from day one.

No Organic History

Brand-new domain with zero SEO signals, no backlinks, and no indexed pages. Every ranking had to be earned from scratch.

Duplicate SKU Crisis

Each shoe size was stored as a separate product — 100 models x 5 sizes = 500 separate listings. Disastrous for UX and SEO.

CRM Sync Architecture

Client needed KeepinCRM to control inventory with automatic sync to OpenCart — a bidirectional data flow requiring careful design.

Bilingual Catalog

All product data, filters, and metadata needed in both Ukrainian and Russian — with standardized dropdowns, not free-text entry.

SEO-Integrated Development

Technical SEO requirements (hreflang, canonical, Schema.org, URL structure) had to be baked in during build, not retrofitted post-launch.

No Existing Analytics

GA4, GTM, and GSC all had to be configured from scratch with a fully working ecommerce tracking layer before first traffic arrived.

Every challenge was addressed before launch. The result: a site that ranked from day one.

OpenCart Build & UI Architecture

Full development from mockup audit through CRM-ready structure

Mock-up Audit

Analysed design files before a single line of code was written. Identified structural issues, missing UI states, and device responsiveness gaps.

UI Gap Fixes

Added missing language switcher dropdown, cart/wishlist item counters in the header, and a product review form on product pages.

UX Restructure

Proposed 3-column review grid, product images in review listings, and moved the "Add Review" action to product cards only.

Variant Architecture

Redesigned product data model: 5 separate size SKUs -> 1 parent card with size/color as modifications. Eliminated catalog bloat.

Result: clean architecture, SEO-ready from the first commit.

KeepinCRM <-> OpenCart Architecture

Designing bidirectional data flow so the CRM is the single source of truth

Parent + Variations

One product card per model. Sizes & colors as OpenCart modifications — eliminating 80%+ of duplicate SKUs.

Field Standardisation

All filter attributes (Type, Season, Collection, Purpose) use dropdown fields — preventing free-text typos from creating garbage filters.

Sync Marker

Each CRM product has an "Update to site?" toggle. Changes only push when the manager explicitly enables sync.

CDN for Media

Product images stored on CDN (bunny.net). CRM stores URLs only. Browser fetches images from nearest edge node.

SEO-Ready Architecture, Built Before Launch

Technical audit delivered before go-live, not as a post-launch patch

SSL & HTTPS

HTTPS enforced with 301 redirect from HTTP on every URL. Prerequisite for all crawling and ranking.

URL Structure

Hyphenated slugs, no Cyrillic, consistent trailing slashes. Filter URLs use human-readable format.

Canonicals & Indexation

Filter pages use canonical to parent category. Cart, checkout, and search results marked noindex.

Competitor Analysis

4 key competitors mapped (yesoriginal, allstars, answear, prm). Link strategy and filter indexation logic derived from their best practices.

hreflang Tags

Ukrainian (uk) and Russian (ru) versions linked with correct x-default. No duplicate content penalty.

Schema.org Markup

Product, BreadcrumbList, and Organization types implemented. Rich snippets ready on day one.

Image Optimisation

WebP format, lazy loading, descriptive ALT attributes. All product images optimised at import.

Sitemap & Robots.txt

Sitemap generated post-launch. Robots.txt configured to allow crawling of all indexed pages and block all tech pages.

Full Measurement Stack — Configured Before First Visit

GA4 + GTM + GSC implemented, tested, and verified. Ecommerce tracking live on launch day.

GA4

Google Analytics 4

- Data stream configured with measurement ID
- Ecommerce module: product impressions, add-to-cart, purchases
- First test transactions recorded in GA4 before go-live

GTM

Google Tag Manager

- Container installed across all site pages
- All marketing tags managed without developer intervention
- Ecommerce data layer structured for GA4 events

GSC

Google Search Console

- Property verified via HTML file upload
- Sitemap submitted post-launch
- Indexed coverage tracked from day 1

Measurement-first approach — every click, session, and conversion tracked from launch.

Month 1 Organic Performance

March 2026 — first full month after launch. All data from Google Search Console & GA4.

New store ranking page 3 average within weeks of launch — impressions +50x, upward trajectory confirmed.

Built Right. Launched Right. Ranking from Day One.

- Full OpenCart development with SEO-ready architecture from mockup stage
- KeepinCRM integration with bidirectional product & order sync
- Complete technical SEO: hreflang, Schema.org, canonical, URL rules
- GA4 + GTM + GSC configured — ecommerce tracking live on launch day
- Position 24.3 average with confirmed upward trend in Month 1
